### ALIGNMENTS

Example 14; Page 34; 80pp; English.

EXAMPLE 183085, R83090-R83096 and R92907-R92913 represent fragments of class I major histocompatibility complex (MEC) antigens. This sequence corresponds to residues 75-84 of the alpha 1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLs) of the patient. 16-MAY.1996 (first entry)
HIA-B3702 CTL modulating peptide (B2702.75-84(L)).

                                                                                                                                                                                                                                                                                                         Nucleotide sequence selectively expressed in pre-B cells - used in probes for determining non-T acute lymphoblast leukaemia and for prepn. of polypeptide(s)

Disclosure; pp; English.

This is encoded by the genomic form of the variable region pre-B-1 sequence. The gene is not rearranged during pre-B cell development and is 4.6 kb upstream of the lambda-5 gene. This protein can associate with itself or with heavy chain V domains expressed in pre-B cells. Vpre-B-1 and lambda-5 form a complete V domain via non-covalent bonds. The gene is expressed only in pre-B cell lines. See also N80470-74, N80476-77 and N82441-42.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                3-1 protein.

This is encoded by the genomic form of the variable region pre-B-2
sequence. The gene is not rearranged during pre-B cell development.

This protein may associate with itself or with heavy chain V domains expressed in pre-B cells. The gene is expressed only in pre-B cells. The gene is expressed only in pre-B cells income and N80470-75, N80476-77 and N82442.

                                                                                                                                                                                                                                                                                                                               Nuclectide sequence selectively expressed in pre-B cells - used in probes for determining non-T acute lymphoblast leukaemia and for prepn. of polypeptide(s)

Disclosure: pp: English:

This is encoded by the human pre-B gene which differs from the mouse pre-B-2 gene (of NB3441) at several posns. The gene is also selectively expressed in pre-B cell lines. Its pattern of expression follows that of Yper-B1 and lambda-5 in the mouse.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleotide sequence selectively expressed in pre-B cells - used in probes for determining non-T acute lymphoblast leukaemia and for prepn. of polypeptide(s)

R830661-R83085, R830960-R83096 and R93007-R92913 represent fragments of
class I major histocompatibility complex (MHC) antigens. This sequenc
corresponds to residues 75-84 of the alpha-1 domain of the class
                                                                                                                                                                                                                                                                                                                                    Mew peptide(s) based on class I HLA antigen domains - used for modulating cytotoxic T-lymphocyte activity towards targets Claim 11; Page 54; 61pp; English.
The peptide is used to modulate cytotoxic T-lymphocyte (CTL) activity, either by inhibition or stimulation. It can be used for inhibiting CTL toxicity in transplantations, for inducing CTL infection. The peptide can also be used for identifying CTLs which bind to it and removing subsets of CTLs from a T-cell composition. This peptide sequence is more commonly found within larger peptide
                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                 R41212;
15-MAR-1994 (first entry)
Peptide fragment of Class I HLA peptide.
Human leukocyte antigen: HLA: peptide: transplantation; neoplasia;
parasitic disease; cytotoxic T lymphocyte; modulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           acceptance period of transplants from MHC unmatched - using Class I B75-84\ \mathrm{MHC} antigen of the recipient

I MHC HLA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to administration for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLs) of the patient.
                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

71424 F71418 are human major histocompatibility complex class 1
(MHC 1) alpha 1 domain derived peptides and peptide mutants, they
were used to modulate interactions between MHC 1 and cell surface
were used to competitive inhibition the peptides diminish the
receptors. Via competitive inhibition the peptides diminish the
receptors response, this feature may be useful for the treatment
of neoplassias, lupus erythematosus and arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  12-0cT-1995 (first entry)

Human MHC 1 alpha 1 domain peptide Dk-(69-85).

Major histocompatibility complex class 1; MHC 1; cell receptor; alpha 1 domain; peptide Dk-(62-85); interaction modulation; arthritis; neoplasias; lupus erythematosus.
                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    12-AUG-1994; U09189.

R71439-R71443 are human major histocompatibility complex class 1 (MFC 1) alpha 1 domain and HLA derived peptides and fusion peptides. They were used to modulate interactions between MFC 1/HLA and cell surface receptors. Via competitive inhibition the peptides diminish the receptors response, this feature may be useful for the treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         R71433 standard; peptide; 17 AA.
R71433;
12-0CT-1995 (first entry)
Human MHC 1 alpha 1 domain peptide [Ala85]-Dk-(69-85).
Major histoompatibility complex class 1; MHC 1; cell receptor;
Major histoompatibility complex class 1; MHC 1; cell receptor;
alpha 1 domain; peptide [Ala85]-Dk-(69-85); interaction modulation;
arthritis; neoplasias; lupus erythematosus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     MHC 1 alpha 1 domain peptide [Ala71]-Dk-(69-85).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Example 4; Page 45; 103pp; English.
R71424-R71438 are human major histocompatibility complex class 1
RMC 1) alpha I domain derived peptides and peptide mutants, they were used to modulate interactions between MHC I and cell surface receptors. Via competitive inhibition the peptides diminish the receptors response, this feature may be useful for the treatment of neoplasias, lupus erythematosus and arthritis.
                                                                                                                                                                                                                                                                                                                                         ö

Human [Phe74] HIA-B27-(62-85) antigen derived peptide.
Human [Phe74]-HIA-B27-(62-85) antigen derived peptide; cell receptor;
Human [Phe74]-HIA-B27-(63-85) antigen derived peptide; cell receptor;
Interaction modulation; arthritis; neoplasias; lupus erythematosus.
           Frample 4; Page 45; 103pp; English.
R71439-R71443 are human major histocompatibility complex class 1
(MRC 1) alpha 1 domain and HLA derived peptides and fusion peptides.
They were used to modulate interactions between MHC 1/HLA and cell surface receptors. Via competitive inhibition the peptides diminish the receptors response, this feature may be useful for the treatment of neoplasias, lupus erythematosus and arthritis.

Human MHC I alpha I domain peptide [Ala78]-Dk-(69-85).

Major histocompatibility complex class 1; MHC 1; cell receptor;

alpha I domain; peptide [Ala78]-Dk-(69-85); interaction modulation;

arthritis; neoplasias; lupus erythematosus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Example 4; Page 45; 103pp; English.

R7144-R71438 are human major histocompatibility complex class 1
R7144-R71438 are human major histocompatibility complex class 1
R7144-R71438 are human major histocompatibility manual competitive deptides and peptide mutants, they were used to modulate interactions between MHC 1 and cell surface receptors. Via competitive inhibition the peptides diminish the receptors response, this feature may be useful for the treatment of neoplasias, lupus erythematosus and arthritis.
                          Example 4; Page 45; 103pp; English. R7144-R71438 are human major histocompatibility complex class 1 (MHC 1) alpha 1 domain derived peptides and peptide nutants, they were used to modulate interactions between MHC 1 and cell surface receptors. Via competitive inhibition the peptides diminish the receptors response, this feature may be useful for the treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           R71424 standard; peptide; 24 AA.
R71424.
12-071-1995 (first entry)
Human MHC 1 alpha 1 domain peptide Dk-(62-85).
Major histocompatibility complex class 1; MHC 1; cell receptor; alpha 1 domain; peptide Dk-(62-85); interaction modulation; arthritis; neoplasias; lupus erythematosus.
                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

R71424-R71438 are human major histocompatibility complex class 1
R71424-R71438 are human major histocompatibility complex class 1
(MHC 1) alpha 1 domain derived peptides and peptide mutants, they were used to modulate interactions between MHC 1 and cell surface receptors. Via competitive inhibition the peptides diminish the receptors response, this feature may be useful for the treatment of neoplastas, lupus erythematosus and arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
Regulating cell surface receptor response - by modulating interaction between MHC class I antigen and the cell surface
                                                                                                                                                                                                                                                                                                                                                                                  Score 46; DB 13; Length 24; Pred. Example 14; Page 34; 80pp; English.
R83061-R83085, R83090 and R92907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence corresponds to residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to administration of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CILS)
                                                                                                                       HIA-B2702 CTL modulating peptide (B2702.75-84).
Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HIA-B2702.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example 4; Page 45; 103pp; English.

R7144-R71438 are human major histocompatibility complex class 1

R7142-R71438 are human major histocompatibility complex class 1

(MHC 1) alpha 1 domain derived peptides and peptide mutants, they
were used to modulate interactions between MHC 1 and cell surface
were used to ompetitive inhibition the peptides diminish the
receptors response, this feature may be useful for the treatment
of neoplasias, lupus erythematosus and arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                    Extension of acceptance period of transplants from MHC unmatched donor hosts - using Class I B75-84 MHC antigen of the recipient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human MHC 1 alpha 1 domain peptide Dk-(69-85).

In Sequence represents the mannanian represents the mannanian represents the protein processor and receil lyates. PAGE as T-cell surface membrane protein processor and receil arth T-cell activation in mammalian T-cells, and is also immunologically cross reactive with the heat shock protein HSc70. p74 is found in a limited number of cell types, but is particularly expressed on and T cells. p74 can be isolated by lysis of a suitable cell with an amphoteric detergent, and then passed through an affinity column containing a covalently bound HIA-B2702 palindromic peptide.

Example of the possed for their effect on the cytolysis. Candidate compounds can be screened for their effect on the cytolysis. Candidate compounds can be screened for their effect on the cytolysis activity of T-cells, by combining the mount of binding between the candidate compound and p74.

Modulation of CTL activity can be inhibited in a cellular composition containing T-cells and antigen presenting cells (APCS), by adding to the mix the extracellular portion of p74, in an amount sufficient to compete containing the binding of the p74 ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WHIS 95-30124/30.

Wew peptide(s) based on Class I HLA antigen domains - used for modulating cytotoxic T-lymphocyte activity towards targets Claim 11; Page 54; 61pp; English.

The peptide is used to modulate cytotoxic T-lymphocyte (CTL)

activity, either by inhibition or stimulation. It can be used for inhibiting CTL toxicity in transplantations, for inducing CTL activity in parasitic diseases and neoplasia and in studies on viral infection. The peptide can also be used for identifying CTLs which bind to it and removing subsets of CTLs from a T-cell composition. This peptide sequence is more commonly found within larger peptide compounds of not more than 30 amino acids in length.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

Human [Phe74]-HLA-B27-(62-85) antigen derived peptide.
Munan [Phe74]-HLA-B27-(62-85) antigen derived peptide; cell receptor; interaction modulation; arthritis; neoplasias; lupus erythematosus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Example 4; Page 45; 103pp; English.
R71439-R71443 are human major histocompatibility complex class 1 (MHZ 19. R714443 are human major histocompatibility complex class 1. They were used to medulate interactions between MHZ I/HLA and cell surface receptors. Via competitive inhibition the peptides diminish the receptors response, this feature may be useful for the treatment of neoplasias, lupus erythematosus and arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Example 4; Page 45; 103pp; English.
R71439-R7143 are human major histocompatibility complex class 1
RMC139-R7143 are human major histocompatibility complex class 1
They were used to modulate interactions between MHC 1/HLA and cell
Surface receptors. Via competitive inhibition the peptides diminish
the receptors response, this feature may be useful for the treatment
of neoplasias, lupus erythematosus and arthritis.

R71439-R71443 are human major histocompatibility complex class 1
RMC 1) alpha 1 domain and HAA derived peptides and fusion peptides.
They were used to modulate interactions between MHC 1/HLA and cell
surface receptors. Via competitive inhibition the peptides diminish
the receptors response, this feature may be useful for the treatment
of neoplasias, lupus erythematosus and arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             12-OCT-1995 (first entry)

Human MHC 1 alpha 1 domain peptide (Ala85]-Dk-(69-85).

Major histocompatibility complex class 1; MHC 1; cell receptor; alpha 1 domain; peptide (Ala85)-Dk-(69-85); interaction modulation; arthritis; neoplasias; lupus erythematosus.
                                                                                             12-OCT-1995 (first entry)

Human MHC 1 and HLA fusion peptide HLA-A2-(69-76)DK-(77-85).

Human MHC 1 and HLA fusion peptide HLA-A2-(69-76)DK-(77-85).

Anjor histocompatibility complex class 1; MHC 1; cell receptor;

Alpha 1 domain; fusion peptide HLA-A2-(69-76)Dk-(77-85);

interaction modulation; arthritis; neoplasias; lupus erythematosus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Example 4; Page 45; 103pp; English.

R71424-R71438 are human major histocompatibility complex class 1
(MHC 1) alpha 1 domain derived peptides and peptide mutants, they
were used to modulate interactions between MHC 1 and cell surface
receptors. Via competitive inhibition the peptides diminish the
receptors response, this feature may be useful for the treatment
of neoplasias, lupus erythematosus and arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

Human MHC 1 alpha 1 domain peptide [Ala68, 75]-Dk-(62-85).
Major histocompatibility complex class 1; MHC 1; cell receptor;
alpha 1 domain; peptide [Ala68, 75]-Dk-(62-85); interaction modulation;
arthritis; neoplasias; lupus erythematosus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Example 4; Page 45; 103pp; English.

R71424-R71438 are human major histocompatibility complex class 1
R71424-R71438 are human major histocompatibility complex class 1
KMC 1) alpha I domain derived peptides and peptide mutants, they were used to modulate interactions between MHC 1 and cell surface receptors. Via competitive inhibition the peptides diminish the receptors response, this feature may be useful for the treatment of neoplasias, lupus erythematosus and arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Example 4; Page 45; 103pp; English.

R71426-R71438 are human major histocompatibility complex class 1
WHC 1) alpha 1 domain derived peptides and peptide mutants, they
were used to modulate interactions between MHC 1 and cell surface
receptors. Via competitive inhibition the peptides diminish the
receptors response, this feature may be useful for the treatment
of neoplasias, lupus erythematosus and arthritis.
                                                                                                                                                                                                                                                                                                                                                                                           12-0cT-1995 (first entry)

Human MHC 1 alpha 1 domain peptide Dk-(62-85).

Major histocompatibility complex class 1; MHC 1; cell receptor; alpha 1 domain; peptide Dk-(62-85); interaction modulation; arthritis; neoplasias; lupus erythematosus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Goldstein A, Goodenow RS, Olsson L; WPI; 95-098577/13. Regulating cell surface receptor response - by modulating interaction between MHC class I antigen and the cell surface
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Regulating cell surface receptor response - by modulating interaction between MHC class I antigen and the cell surface
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1; Indels

Human MHC 1 alpha 1 domain peptide [Ala71]-Dk-(69-85).

Major histocompatibility complex class 1; MHC 1; cell receptor;
alpha 1 domain; peptide [Ala71]-Dk-(69-85); interaction modulation;
arthritis; neoplasias; lupus erythematosus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          12-OCT-1995 (first entry)

Human MHC 1 alpha 1 domain peptide [Ala78]-Dk-(69-85).

Major histocompatibility complex class 1; MHC 1; cell receptor;
alpha 1 domain; peptide [Ala78]-Dk-(69-85); interaction modulation;
arthritis; neoplasias; lupus erythematosus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Example 4; Page 45; 103pp; English.
R71424-R71438 are human major histocompatibility complex class 1
R71424-R71438 are human major histocompatibility complex class 1
(MHC 1) alpha 1 domain derived peptides and peptide mutants, they were used to modulate interactions between MHC 1 and cell surface receptors. Via competitive inhibition the peptides diminish the receptors response, this feature may be useful for the treatment of neoplassas, lupus erythematosus and arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     R71424-R71438 are human major histocompatibility complex class I (MHC 1) alpha 1 domain derived peptides and peptide mutants, they were used to modulate interactions between MHC 1 and cell surface receptors. Via competitive inhibition the peptides diminish the receptors response, this feature may be useful for the treatment of neoplassas, lupus erythematosus and arthritis.

Human MHC 1 alpha 1 domain peptide (Ala70, 771)-Dk-(62-85).

Major histocompatibility complex class 1; MHC 1; cell receptor; alpha 1 domain; peptide (Ala70, 771-Dk-(62-85); interaction modulation; arthritis; neoplasias; lupus erythematosus.
                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Example 4; Page 45; 103pp; English. R71424-R71438 are human major histocompatibility complex class 1 (MHC 1) alpha 1 domain derived peptides and peptide mutants, they were used to modulate interactions between MHC 1 and cell surface receptors. Via competitive inhibition the peptides diminish the receptors response, this feature may be useful for the treatment of neoplasias, lupus erythematosus and arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

БŢ	Compsns. comprising lymphoid surface membrane proteins - which may
PŢ	inhibit cytolytic activity and differentiation of CTLs.
PS	Example; Page 11; 29pp; English.
႘	This sequence represents the alphal-helix of the
ပ္ပ	human-leucocyte-associated antigen B2702 (HLA-B2702). This sequence,
႘	epitopes, and palindromes of it (such as R95428) can be used to isolate
ပ္ပ	the protein p74 from a T-cell lysate. p74 is a T-cell surface membrane
ပ္ပ	protein associated with T-cell activation in mammalian T-cells, and is
ប្ដ	also immunologically cross reactive with the heat shock protein Hsc70.
႘	p74 is found in a limited number of cell types, but is particularly
당	expressed on B and T cells. p74 can be isolated by lysis of a suitable
ខ	cell with an amphoteric detergent, and then passed through an affinity
ပ္ပ	column containing a covalently bound HIA-B2702 palindromic peptide.
ပ္ပ	Compositions comprising the extracellular fragment of p/4 combined with

PT Compens. Comparising lymphoid surface membrane proteins - which may inhibit cytolytic activity and differentiation of CTLS.

PS Example; Page 11; 29pp; English.

Example; Page 11; 29pp; English.

CC (11) These sequences can be used to isolate the protein contain a T-cell lysate. P74 is a T-cell surface membrane protein associated with T-cell activation in mammalian T-cells, and is also immunologically cross reactive with the heat shock protein Hsc?O. P74 from a T-cell lysate. P74 is a T-cells, and is also immunologically cross reactive with the heat shock protein Hsc?O. P74 is a T-cell surface membrane protein associated with the heat shock protein Hsc?O. P74 is a T-cells. P74 can be isolated by lysis of a suitable cell with an emphoteric detergent, and then passed through an affinity column containing a covalently bound HIA-B2702 palindromic peptide.

CC Compositions compressing the extracellular fragment of P74 condidate compositions compressing the extracellular fragment of P74 and determining the amount of binding between the candidate compound and P74.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Mew peptide(s) based on Class I HLA antigen domains - used for modulating cytocoxic T-lymphocyte activity towards targets Claim 11: Page 54: 61pp; English.

The peptide is used to modulate cytocoxic T-lymphocyte (CTL) activity, either by inhibition or stimulation. It can be used for inhibiting CTL toxicity in transplantations, for inducing CTL activity in parasitic diseases and neoplasia and in studies on viral infection. The peptide can also be used for identifying CTLs which bind to it and removing subsets of CTLs from a T-cell composition. This peptide sequence is more commonly found within larger peptide sequence 10 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              15-MAR-1994 (first entry)
Peptide fragment of Class I HLA peptide.
Human leukocyte antigen; HLA; peptide; transplantation; neoplasia;
parasitic disease; cytotoxic T lymphocyte; modulation.

Claim 15; Page 9; 80pp; English.
R83061-R83085, R83090-R83096 and R92907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence corresponds to residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLs) Sequence 10 AA;
                                                                           HIA-B2702 CTL modulating peptide (B2702.75-84).
Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HIA-B2702.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   16-MAY-1996 (first entry)
HLA-B2702 CTL modulating peptide (B2702.75-84(D)).
Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC;
Immunosuppressant; graft versus host disorder; transplantation; therapy;
class I MHC; HLA-B2702.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Example 14; Page 34; 80pp; English.
R83061-R83085, R83090-R83096 and R92007-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence corresponds to residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                      Clayberger C, Krensky AM, Parham P;

          than an anomal and a sequence represents the human-leucocyte-associated antigens. This sequence represents the human-leucocyte-associated antigens. This sequence represents the than 19702 84-79-84 palindrome. These sequences can be used to isolate the protein passociated with T-cell activation in mammalian T-cells and is protein associated with T-cell activation in mammalian T-cells, and is also immunologically cross reactive with the heat shock protein Hsc70. The sequence of cell types, but is particularly expressed on B and T cells. P/A can be isolated by lysis of a suitable cell with an amphoteric detergent, and then passed through an affinity column containing a covalently bound HLA-B3702 palindromic peptide. Compositions comprising the extracellular fragment of P/A combined with HLA-B2702.60-84 (see R95416), induces calcium influx, and inhibits compounds can be screened for their effect on the cytolytic activity of compounds can be screened for their effect on the cytolytic activity of determining the amount of binding between the candidate compound and p/A. Containing T-cells and antigen presenting cells (APCs), by adding to the mix the extracellular portion of P/A, in an amount sufficient to compete containing of the p/A, in an amount sufficient to compete containing the inhibited in a cellular composition of Services.
a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CILS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                12-NOV-1996 (first entry)

Munan-leucocyte-associated antigens. This sequence represents the human-leucocyte-associated antigens. This sequence represents the His-B700 84-75-84 palindrome. These sequences can be used to isolate the protein p74 from a T-cell lysate. P74 is a T-cells, and is protein associated with T-cell lysate. P74 is a T-cells, and is protein associated with T-cell activation in mammalian T-cells, and is also immunologically cross reactive with the heat shock protein Hsc70.

P74 is found in a limited number of cell types, but is particularly p74 is found in a limited number of cell types, but is particularly cell with an amphoteric detergent, and then passed through an affinity column containing a covalently bound HIA-B7702 palindromic peptide.

Column containing a covalently bound HIA-B7702 palindromic peptide.

Compositions comprising the extracellular fragment of p74 combined with HIA-B7702.60-84 (see R95416), induces calcium influx, and inhibites compounds and be screened for their effect on the cytolytic activity of T-cells, by combining them with the extracellular portion of p74 and determining the amount of binding between the candidate compound and p74.

Modulation of CTL activity can be inhibited in a cellular composition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Example 15; Page 36; 80pp; English.

R83061-R83085, R83090-R83096 and R92907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence corresponds to residues 70-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLs) of the patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   12-NOV-1996 (first entry)

R83061-R83085, R83090-R83096 and R92907-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HIA-B3702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a bubtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CILS)
containing T-cells and antigen presenting cells (APCs), by adding to the mix the extracellular portion of p74, in an amount sufficient to compete with p74 for the binding of the p74 ligand. Sequence 20 AA;
                                                                                                                                                                                                                       HIA-B2702 CTL modulating peptide (B2702.84-75/75-84).

R83061-R83085, R83090-R83096 and R92907-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        HLA-B2702.60-84.

CR95413, and R95415-R95431 represent palindromes and fragments of human-leucocyte-associated antigens. This sequence represents the than R95415-R95431 represent palindromes and fragments of HLAB38 (6084. These sequences can be used to isolate the protein p74 from a T-cell lysate. P74 is a T-cell surface membrane protein associated cuth T-cell activation in mammalian T-cells, and is also immunologically cross reactive with the heat shock protein H8570. p74 is found in a constaining a covalently bound HLA-B2702 palindromic peptide.

Containing a covalently bound HLA-B2702 palindromic peptide.

Compositions comprising the extracellular fragment of p74 combined with HA-B2702 palindromic peptide.

Compositions comprising the extracellular fragment of p74 combined with the extracellular fragment of p74 compound and p74.

Cytotoxic T lymphocyte (CTL) differentiation or cytolytis. Candidate compounds can be screened for their effect on the cytolytic activity of determining them with the extracellular portion of p74 and determining the mount of binding between the candidate composition containing T-cells and antigen presenting cells (APCs), by adding to the mix the extracellular portion of p74, in an amount sufficient to compete with p74 for the binding of the p74 ligand.
                                                                                                                                                                                                              HLA-B2702 CTL modulating peptide (B2702.60-84). Cytocoxic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-B2702.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

R83061-R83085, R8309-R83096 and R82907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence corresponds to residues 60-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmarched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    16-MAY 1996 (first entry)
HIABS CTL modulating peptide (B38.6084).
Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC;
immunosuppressant; graft versus host disorder; transplantation; therapy;
class I MHC; HLAB38.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mew peptide(s) based on class I HLA antigen domains - used for modulating cytotoxic T-lymphocyte activity towards targets Claim 8; Page 53; 61pp; English.

The peptide (or a fragment of at least 10 amino acids, joined at at least one terminus to a sequence other than that of wild type HLA antigen) is used to modulate cytotoxic T-lymphocyte (CTL) activity, either by inhibition or stimulation. It can be used for inhibiting CLL toxicity in transplantations, for inducing CLL activity in parasitic diseases and neoplashs and in studies on viral infection. The peptide can also be used for identifying CTLs which bind to it and removing subsets of CTLs from a T-cell composition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

Rample 13; Page 32; 80pp; English.
R83061-R83085, R83090-R83096 and R92907-R92913 represent fragments of class I major histocompatability complex (MHC) antigens. This sequence corresponds to residues 60-84 of the alpha-1 domain of the class I MHC HLAB38. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLs) of the patient.

CCC (LAR-19-84 Pallinformer. These sequences can be used to isolate the protein p74 from a T-cell lysate. p74 is a T-cell surface membrane to protein associated with T-cell activation in mammalian T-cells, and is a sultable compound in a limited number of cell types, but is particularly constructed to the passed through an affinity column containing a covalently bound HLA-B2702 pallindromic peptide.

CC (Compositions comprising the extracellular fragment of p74 and cells, by combining them with the extracellular portion of p74 and determining the amount of binding between the candidate compound and p74.

Modulation of CTL activity can be inhibited in a cellular composition containing T-cells and antigen presenting cells (APCS), by adding to the with p74 for the binding of the p74 ligand.

```
and is also immunologically cross reactive with the heat shock protein Hsc70. p74 is found in a limited number of cell types, but is particularly expressed on B and T cells. p74 can be isolated by lysis of a sultable cell with an amphoteric detergent, and then passed through an affinity column containing a covalently bound HLA-B2702 palindromic peptide. Compositions comprising the extracellular fragment of p74 combined with HLA-B2702.60-84 (see R95416), induces calcium influx, and inhibits cytotoxic T lymphocyte (CTL) differentiation or cytolysis. Candidate compounds can be screened for their effect on the cytolytic activity of T-cells, by combining them with the extracellular portion of p74 and determining the amount of binding between the candidate compound and p74. Modulation of CTL activity can be inhibited in a cellular composition containing T-cells and antigen presenting cells (APCs), by sequence 20 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         human-leucocyte-associated antigans. This sequence represents the human-leucocyte-associated antigans. This sequence represents the HLA-B2702 84-75-84 palindrome. These sequences can be used to isolate the protein py4 from a T-cell lysate. P74 is a T-cell surface membrane protein associated with T-cell intrivation in mammalian T-cells, and is also immunologically cross reactive with the heat shock protein Hsc70. P74 is found in a limited number of cell types, but is particularly capressed on B and T cells. P74 can be isolated by lysis of a suitable cell with an amphoteric detergent, and then passed through an affinity compositions comprising the extracellular fragment of F74 combined with HA-B2702.60-84 (see R95416), induces calcium influx, and inhibits compositions comprising the extracellular fragment of F74 combined with HA-B2702.60-84 (see R95416), induces calcium influx, and inhibits composition of CTL activity can be inhibited in a cellular compound and F74. And determining the amount of binding between the candidate compound and F74. Modulation of CTL activity can be inhibited in a cellular composition of mix the extracellular portion of F74, in an amount sufficient to compete containing T-cells and antigen presenting cells (APCS), by adding to the containing the binding of the F74 ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     12-NOV-1996 (first entry)

R83061-R83085, R83090-R83096 and R92907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75.84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CILS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             16-MAY-1996 (first entry)
HLA-B2702 CTL modulating peptide (B2702.84-75/84-75).
Cytotoxic I lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-B2702.
                                                                                                                                               HLA-B2702 CTL modulating peptide (B2702.84-75/75-84(T)).
Cytocoxic T lymphocyte; CTL; major histocompatibility complex; MHC;

Polymorlectide(s) encoding human protocadherins pc3 and pc4 and rat pc5 involved in cell-cell adhesion and regulation activities Example 2; Page 67-68; 146pp; English.

R87142-R87144 represent partial fragments of the drosophila protocadherin sequence. The cDNAs encoding these sequences were isolated after screening a drosophila whole body cDNA preparation with the primers shown in 103575 and 103576. The primers were constructed from portions of the amino acid sequences of the third and fourth extracellular domains of
      For modulating natural binding and regulating activities.

Example: Page 63: 114pp; English.

Two regions of conserved AA sequence, one from the middle of the Two regions of conserved AA sequence, one from the other from the C.C. third cadherin extracellular subdomain (EC-4) were identified. The corresp. degenerate oligos (06694), 068950) were designed for use as PCR primers. PCR was carried out on a rat brain cDMA prepn. Two major bands of about 450 bps and 130 bps were found. The 450 bp and corresponded to the expected length between the two primer sites, but the 130 bp band could not be predicted from any of the previously identified cadherin sequences. The 450 bp and 130 bp bands were extracted and sequenced. Nineteen novel partial cDNA clones were isolated. The DNA and deduced AA sequences of the clones were isolated. The DNA and deduced AA sequences of the clones (including sequences corresp. to the PCR primers) are given in 068911.06896994 and R5880-ES8878. Various cDNA fragments conse and xenopus brain cDNA prepns. by PCR using the above primers. The DNA and deduced AA sequences of the resulting PCR fragments corresp. To the PCR primers.

The DNA and deduced AA sequences indicates a similarity in particular, the deduced AA sequences indicates a similarity, in particular, of the deduced AA sequences indicates a similarity, in particular, there are three sets of clones that appear to be cross-species homologues: RAT-218, MOUSE-322 and HUMAN-11; RAT-314, MOUSE-321 and HUMAN-11; AAA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              29-AUG-1996 (first entry)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       EXAMPLE 15; Page 36; 80pp; English.
R83061-R83085, R83090-R83096 and R92907-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (Comparad to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CILS)
                                                                                                                                                                                                                                                                                                                                                                                                     16-MAY.1996 (first entry)
HLA-B2702 CTL modulating peptide (B2702.84-75/75-84).
Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-B2702.
the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLs) of the patient.
                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ô

published cadherin sequences. The cytoplasmic domain of cadherin interacts with the cytoskeleton through catenins and other cytoskeleton associated proteins. The cytoplasmic domain is not present in all cadherins, but in those which possess it, it is essential for the cadherins adhesive function. The cadherins which do not possess a cytoplasmic domain appear to function via a different method from those with a cytoplasmic domain. These protein sequences are involved in cell-call adhesion. These sequences may have regulatory functions in the cell, as well as the cell-call adhesive properties. Antibodies produced against these sequences are useful for modulating the binding activity of these protocadherins, and can be used therapeutically.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Example 15; Page 36; 80pp; English.

R83061-R83085, R83090-R83096 and R92307-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702.

These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (comparate to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CILs)
                                                                                                                                                                                                                                                                                                                                                                                                                                              16-MAY-1996 (first entry)
HLA-B2702 CTL modulating peptide (B2702.84-75(T)/75-84(T)).
Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-B2702.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         HLA-B2702 CTL modulating peptide (B2702.84-75(T)/75-84). Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-B2702.

Example 15; Page 36; 80pp; English.

Example 15; R83096-R83096 and R92907-R92914 represent fragments of class I major histocompatibility complex (MRC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HLA-B2702. These sequences can be used to extend the period of complex complex from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime modulate for unmints). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLs) of the patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

R83061-R83085, R83090-R83096 and R92907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HLA-B2702.

These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to administration for unrent treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   16-MAY-1996 (first entry)

HIA-B2702 CTL modulating peptide (B2702.84-75/75-84(T)).

Cytotoxic I lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-B2702.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

R83061-R83085, R83090-R83096 and R92907-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a
                                                                                                 16-MAY-1996 (first entry)
HIA-B2702 CTL modulating peptide (B2702.84-75/84-75).
Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-B2702.
                                                                                                                                                                                                                                                                                                            Example 15; Page 36; 80pp; English.

Example 15; Ras090-Ras096 and R92907-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is a dimer of residues 75-84 of the alpha-1 domain of the class I MHC HLA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLs) of the patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       16-MAY-1996 (first entry)

Claim 17; Fig 5; 55pp; French.

The present sequence is that of the JEG80 protein which was isolated from Bacillus thuringlensis ser. Jegathesan 37; [8149367], it is a crystal toxin of mol. wt. 80 kD which is active against dipteran insects, esp. mosquitoes. The full-length, recombinant JEG80 toxin, had mean LG50 values (in ng/ml) after 48 hours of 18.8, 42.7 and 10.1 against larvae of Aedes aegypti. Anopheles stephensi and Culex pipiens, respectively Wild-type Bijeg367 crystals gave values of 47.4, 54.5 and 9.6. The Mosquito Species tested) than the Bt CryIVD

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polynucleotide(s) encoding human protocadherins pc3 and pc4 and rat pc5 - involved in cell-cell adhesion and regulation activities

Example 2, Page 67-68, 146pp; English.

Example 2, Page 67-68, 146pp; English.

ERSIA12-RR144 represent partial fragments of the drosophila protocadherin sequence.

ERSIA12-RR144 represent partial fragments of the drosophila protocadherin sequence.

The cDNAS encoding these sequences were isolated after soremening a drosophila whole body cDNA preparation with the primers shown in TO3575 and TO3576. The primers were constructed from portions of the amino acid sequences of the third and fourth extracellular domains of the camino acid sequences of the third and fourth extracellular domains of the published cadherin sequences. The cytoplasmic domain of cadherin and construction through catenins and other cytoskeleton cascociated proteins. The cytoplasmic domain is not present in all cadherins adhesive function. The cadherins which do not possess a cytoplasmic domain appear to function via a different method from those with a cytoplasmic domain. These protein sequences are involved in coll-cell adhesion. These sequences may have regularory functions in the cell-cell adhesive properties. Antibodies produced against these sequences are useful for modulating the binding activity of construction of these protocadherins, and can be used therapeutically.

Claim 3: Page 21-22: 178pp; English.

CC This sequence represents an enzyme that forms a non-reducing sugar with a trehalose end group, from a reducing amylaceous saccharide. The amylaceous saccharides are a degree of glucose polymerisation of 3 or higher. This sequence was extracted from a liquid culture of Rhizobium species M-11. By using an oligonucleotide probe based on a fragment of this sequence, the encoding sequence was obtained. The encoding sequence was then ligated into a vector and used to produce M-11 in E.coli transformants. This can also be performed for the DNA encoding enzyme compact of the superstand for the buse of the color of the second adjuvants. The sugars can also be used as intermediates for the holose. The advantages with using these sugars, are that, they are the advantages with using these sugars, are that, they are practically non-reducing (so no browning reaction occurs when they are heated with proteins), have a mild but good quality sweetness, adequate viscosity and moisture-retaining properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ô

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 NN encoding enzyme reduces amylaceous saccharide to produce non-reducing sugar with trehalose end gp. - useful in foods, cosmetics, pharmaceuticals, etc.

To sametics, pharmaceuticals, etc.

Claim 3; Page 23-25; 178pp; English.

Claim 3; Page 20-25; 178pp; English.

This sequence represents an enzyme that forms a non-reducing sugar with a creaming group, from a reducing amylaceous saccharide. The anylaceous saccharides have a degree of glucose polymerisation of 3 or higher. This sequence was extracted from a liquid culture of the enzyme sequence of glucose polymerisation of 3 or higher. This sequence was then ligated into a vector and used to produce the encoding sequence was then ligated into a vector and used to produce the encoding sequence was then ligated into a vector and used to produce the encoding enzyme M-11 (see TO4155), which was obtained from Rhizobium sp. CC an be used in foods, cosmetics, pharmaceuticals and feeds. They are come used in foods, cosmetics, pharmaceuticals and feeds. They are sugars produced by the action of these enzymes come used an adjuvants. The sugars can also be used as intermediates to retribatose. The advantages with using these sugars, are that, they are practically non-reducing (so no browning reaction occurs when they care heated with proteins), have a mild but good quality sweetness, consider and adjuvente-retaining properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             16-MAY-1996 (first entry)
HLA-B2702 CTL modulating peptide (B2702.84-75(T)/75-84(T)).
Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; immunosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HLA-B2702.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Score 44; DB 15; Length 775;

R8306-R83085, R83090-R83096 and R92907-R92913 represent fragments of class I major histocompatibility complex (WHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HIA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime modulate for unministered to the compared to the lifetime modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLs) of the patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Example 15; Page 36; 80pp; English.

R83061-R83085, R83090-R83096 and R93907-R92914 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HAA-B2702. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subcharapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic T lymphocytes (CTLS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               HIA-B2702 CTL modulating peptide (B2702.84-75(T)/75-84).
Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC; immnosuppressant; graft versus host disorder; transplantation; therapy; class I MHC; HIA-B2702.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                Claim 11; Page 47-50; 119pp; English.

HA (051088-94) and fusion glycoprotein (051095-97) sequences of several wild-type measles strains are given. Shared amino acid variations in wild-type measles glycoproteins are identified in five wild-type measles viruses. A consensus polypeptide, the amino acid sequence of which reflects variation common to more than one wild-type strain, is the basis for constructing live attenuated vaccines, or recombinant vaccines to replace older, less efficacious vaccines. Immunological reagents useful in differentiating wild-type measles strains from other known strains can also be produced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         genetic engineering.
Claim 1; Fig 2; 10pp; Japanese.
The sequence was obtd. from asix clones isolated from a pig liyer cDNA library. The clones, lambda AARE 419, 450, 451, 452, 521 and 522 cover the entire sequence of the gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

-!- FUNCTION: DNA-DEPENDENT RNA POLYMERASE CATALYZES THE TRANSCRIPTION
                                                                                                                                                                                                                                                                                                                                                                                                          OF DNA INTO RNA USING THE FOUR RIBONUCLEOSIDE TRIPHOSPHATES AS SUBSTRATES.
-!- CATALYTIC ACTIVITY: N NUCLEOSIDE TRIPHOSPHATE - N PYROPHOSPHATE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            RNA(N).

SUBUNIT: IN CHLOROPLAST THE RNA POLYMERASE IS COMPOSED OF FOUR SUBUNITS: ALPHA, BETA, BETA', AND BETA'.

SIMILARITY BELONGS TO THE RNA POLYMERASE BETA CHAIN FAMILY.

protein - protein database search, using Smith-Waterman algorithm MPsrch\_pp

Thu May 22 08:42:58 1997; MasPar time 2.50 Seconds 68.327 Million cell updates/sec Run on:

Tabular output not generated.

>US-08-653-294-5 (1-6) from US08653294.pep 53 1 RILLRY 6

Description: Perfect Score:

Sequence:

Scoring table:

89912 seqs, 28507787 residues PAM 150 Gap 15 Searched:

Post-processing:

Minimum Match 0% Listing first 45 summaries Maximum DB seq length 60

Database:

1:ann1 2:ann2 3:ann3 4:ann4 5:unann1 6:unann2 7:unann3 8:unann4 9:unann5 10:unann6 11:unann7 12:unann8 13:unann9 14:unann10 15:unenc 16:unrev pir50

Mean 22.859; Variance 32.635; scale 0.700 Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
